

TIDAL MONITORING DATA TO FEBRUARY 2016

Tweed River Mean Low Water Spring (MLWS) tide level varied from a minimum of -0.367 m AHD to a maximum of -0.552 m AHD for the six months September 2015 to February 2016.

This period of analysis was characterised predominantly by oceanic events with small catchment events evident (i.e. rainfall and freshwater flows).

Over the last 6 months the Spring Tidal Range has been consistent and there has been little change in the tidal behaviour of the system.

The TRESBP has not had a significant impact on the Lower Tweed River tidal behaviour to February 2016.

The next set of data is due in September 2016 (six months).
